

Exercice 1 :**a/**

a)

Calculons d'abord les résultantes :

Calcul de R_1 :

$$R_1 = 4 \times 2 = 8 \text{ kN}$$

Point d'application : $x_1 = 5 + 2/2 = 6 \text{ m de point A}$ Calcul de R_2 :

$$R_2 = (10 - 4) \times 2 \times \frac{1}{2} = 6 \text{ kN}$$

Point d'application : $x_2 = 5 + \frac{2}{3} = 5,66 \text{ m de point A}$ Calcul de R_3 :

$$R_3 = (8 - 2) \times 5 \times \frac{1}{2} = 15 \text{ kN}$$

Point d'application : $x_3 = 2 \times \frac{5}{3} = \frac{10}{3} \text{ m de point A}$ Calcul de R_4 :

$$R_4 = 2 \times 5 = 10 \text{ kN}$$

Point d'application : $x_4 = 2,5 \text{ m de point A}$

Les réactions :

$$\sum M_A = 0 \Leftrightarrow B_y \times 7 - R_1 \times 6 - R_2 \times 5,66 - R_3 \times \frac{10}{3} - R_4 \times 2,5$$

$$\Rightarrow B_y = 22,42 \text{ kN}$$

$$\sum F_y = 0 \Leftrightarrow A_y + B_y - R_1 - R_2 - R_3 - R_4 = 0$$

$$\Rightarrow A_y = 16,58 \text{ kN}$$

$$\text{Et } A_x = 0$$

b/

$$W = W_{\max} \sin(\pi x/L)$$

Calcul de la résultante :

$$R = \int_0^L W dx = \int_0^L W_{\max} \sin\left(\pi \frac{x}{L}\right) dx$$

$$R = \text{int}\left(W_{\max} \cdot \sin\left(\frac{\pi x}{L}\right), x=0..L\right);$$

$$R = \frac{2 W_{\max} L}{\pi}$$

$$\sum F_y = 0 \Leftrightarrow A_y - R = 0$$

$$\Rightarrow A_y = \frac{2LW_{\max}}{\pi}$$

$$Ma = R \times x = \frac{2LW_{\max}}{\pi} \times \frac{L}{2} = \frac{L^2W_{\max}}{\pi}$$

Exercice 2 :

$$\sum F_x = 0 \Leftrightarrow w \times (6m) - D_H = 0 \Rightarrow D_H = 30 \text{ kN}$$

$$\sum M_D = 0 \Leftrightarrow Q_1 \times (4,5 + 4,5) - A_V \times 12 - w \times 6 \times \frac{6}{2} = 0 \Rightarrow A_V = 7,5 \text{ kN}$$

$$\sum Fy = 0 \Leftrightarrow A_v + D_v - Q_1 = 0 \Rightarrow D_v = 12,5 \text{ kN}$$

Exercice 3 :

DCL global :

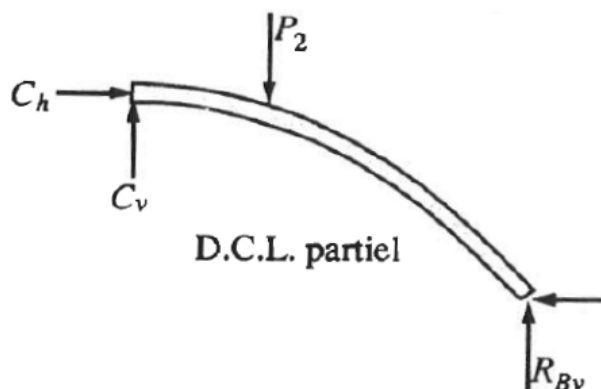

$$(1): \sum Fx = 0 \Leftrightarrow R_{Ah} - R_{Bh} = 0$$

$$(2): \sum Fy = 0 \Leftrightarrow R_{Av} + R_{Bv} - P_1 - P_2 = 0$$

$$(3): \sum M_A = 0 \Leftrightarrow -R_{Bh} \times h + R_{Bv} \times L - P_1 \times a_1 - P_2 \times a_2 = 0$$

Il faut chercher une quatrième équation, donc on fait un DCL local sur la partie CB et on obtient :

$$(4): \sum M_C = 0$$

$$\Leftrightarrow -R_{Bh} \times (h + h')$$

$$+ R_{Bv} \times \frac{L}{2}$$

$$- P_2 \times (a_2 - a_c) = 0$$

```

restart;
equ1 := Rah - Rbh = 0;
equ2 := Rav + Rbv - P1 - P2 = 0;
equ3 := Rbv·L - Rbh·h - P1·a1 - P2·a2 = 0;
equ4 :=  $\frac{Rbv \cdot l}{2} - Rbh \cdot (h + H) - P2 \cdot (a2 - ac) = 0;$ 

```

$$equ1 := Rah - Rbh = 0$$

$$equ2 := Rav + Rbv - P1 - P2 = 0$$

$$equ3 := RbvL - P1 a1 - P2 a2 - Rbh h = 0$$

$$equ4 := \frac{Rbv l}{2} - Rbh (h + H) - P2 (a2 - ac) = 0$$

```

solve({equ4, equ3}, {Rbv, Rbh});

```

$$\left\{ Rbh = -\frac{2LP2a2 - 2LP2ac - P1a1l - P2a2l}{2HL + 2Lh - hl}, Rbv = \frac{2(HP1a1 + HP2a2 + P1a1h + P2ach)}{2HL + 2Lh - hl} \right\}$$

Cherchons les réactions au point A :

$$Rah = -\frac{2LP2a2 - 2LP2ac - P1a1l - P2a2l}{2HL + 2Lh - hl}$$

$$Rav = \frac{2HLP1 + 2HLP2 - 2HP1a1 - 2HP2a2 + 2LP1h + 2LP2h - 2P1a1h - P1hl - 2P2ach - P2hl}{2HL + 2Lh - hl}$$

Exercice 4 :

$$C = \begin{pmatrix} 0 \\ 0,3 \\ 0 \end{pmatrix} \text{ et } D = \begin{pmatrix} 0,125 \\ 0 \\ 0,4 \end{pmatrix} \text{ donc } \overrightarrow{CD} = 0,125 \vec{i} - 0,3 \vec{j} + 0,4 \vec{k}$$

$$\text{et } CD = \sqrt{0,125^2 + 0,3^2 + 0,4^2} = 0,515$$

$$\vec{T} = T \overrightarrow{\lambda_{CD}} = T \frac{\overrightarrow{CD}}{CD}$$

$$\Rightarrow \vec{T} = T \left(\frac{0,125 \vec{i} - 0,3 \vec{j} + 0,4 \vec{k}}{0,515} \right) = (0,242 \times T) \vec{i} - (0,582 \times T) \vec{j} + (0,776 \times T) \vec{k}$$

Afin de trouver la tension, on calcule la somme des moment suivant l'axe Ox :

$$\sum M_{Ox} = 0 \Leftrightarrow 0,3 \times Tz - 0,2 \times W = 0 \text{ avec } Tz = 0,776 \times T$$

$$\Rightarrow T = \frac{0,2 \times W}{0,3 \times 0,776} = \frac{0,2 \times 200 \times 9,81}{0,3 \times 0,776} = 1685,56 \text{ N}$$
